Jago World

Give your world somewhere to live.

Who lives here? What happened before the story began? What is on the other side of that mountain? Jago World gives the people, places and ideas of a story somewhere to live together.

A good place to begin

Connect characters, lore, maps, family trees and timelines in a free worldbuilding and writing studio.

Inside this guide
Start with a small project. Explore the toolbox. Choose the right export. Take the result into another studio.

Start small. Make it yours.

1. Start your world

Create a world, then add a character, place or faction. Link entries as the setting grows.

2. Make a map

Create a new map directly from the map workspace. Pick a blank starting state or a starter, then draw and edit its geography or site.

3. Connect the story

Add character portraits, family relationships and timeline events. Set the story present so the chronology has a clear point of view.

4. Share an intentional view

Use Explore for reading and full-screen maps. Export a map, a family tree or a reference pack for the people following your story.

Your toolbox

Keep the world connected

Build a world library of characters, places, factions, world rules and other lore, with custom entry types.

Use linked entries, relationship connections and asset references to keep ideas together.

Write scenes and reference documents at the writing desk.

Place events on a timeline and choose the story's present.

Genre starting points provide prompts and settings that can be changed or removed.

Optional spelling checks help with ordinary prose while leaving you free to use invented names.

Put it on a map

Start with blank land, ocean, space or an interior, without returning to the main desk for each new map.

Generate editable geography, settlements, sites and interior starting layouts, then refine them with the manual tools.

Draw and edit shapes, land, regions, routes, rivers, symbols and labels.

Build room layouts, fortified sites, ships and space-station layouts with the map construction tools.

Resize selections freely or keep their proportions; rotate and arrange elements.

Use atmosphere, local detail, overlays, frames, markers, legends and scale bars to finish a map.

Import Material or Repeat colour tiles as repeating land, water, wood, stone, forest, sand or paper surfaces. Adjust tile width, rotation and offsets.

Meet the family

Give characters an editable illustrated avatar or import and crop your own portrait.

Portraits follow characters into entries, reading views, sheets and family trees.

Connect parents, children, partners, adoptive and chosen-family relationships, or succession links.

Focus on a person, ancestors, descendants or connected relatives; fold branches and search the tree.

Create Storybook, Archive, Cinematic or Blueprint family presentations with portraits/cards, headings, dates and a relationship key.

Explore the story

Explore world offers a dedicated reading view for scenes, entries, maps and linked lore.

Fullscreen maps support zoom, pan and entry links.

Use generated names and emblem tools as starting points for your own editable world details.

Export a readable world bible or a reference bundle when you want to share the setting.

Take it further.

Save the editable source

Your native project keeps the studio-specific editing information. Save it before making finished exports or passing a rendered result to another tool.

Export options

Editable .jagoworld projects
World-bible Markdown
Readable HTML references
Structured JSON world data
Reference ZIP bundles with text, maps and assets
Map PNG, SVG and map data
Styled family-tree PNG and SVG
Portrait PNG and SVG

Material / Repeat

Bring repeat tiles into map roles such as land, water, floor or stone.

Sound

Attach a soundtrack or ambience for a world/project preview.

Library

Collect maps, family-tree exports and reference artwork into a project library.

Useful things to know.

Map generation is artistic, not tectonic, hydrological or architectural simulation.

Complex family relationships can still produce crossing connections.

Public exports can omit dedicated private fields, but secrets written in ordinary prose require your review.

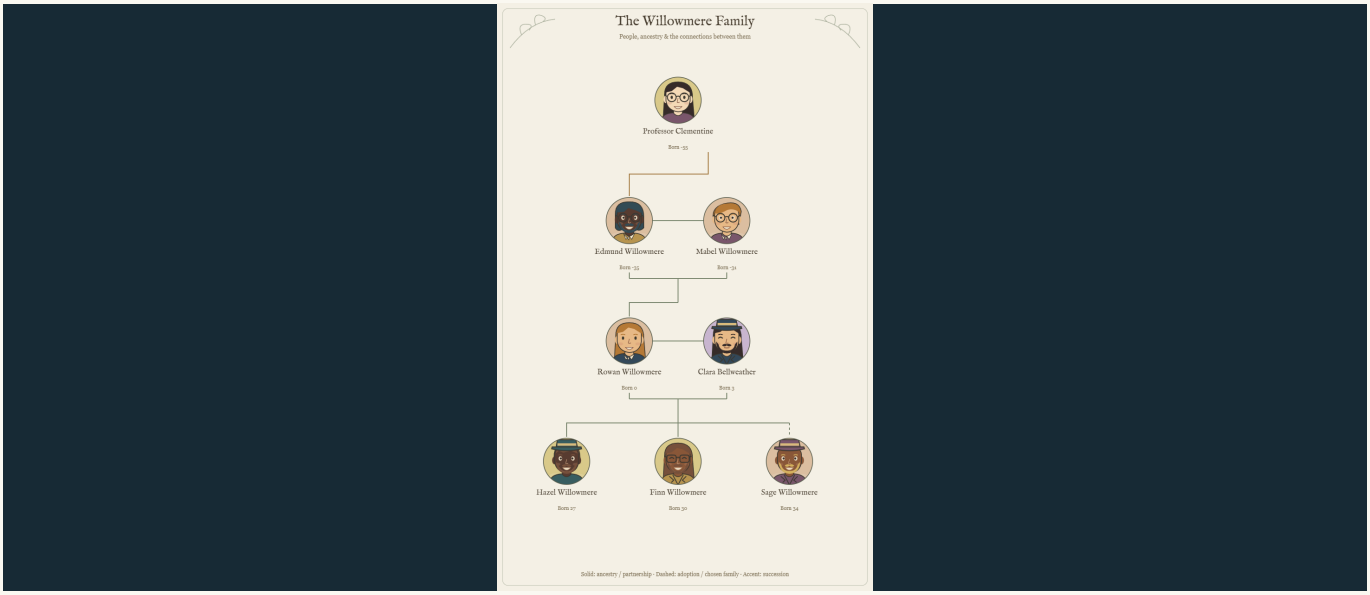

Spellchecking depends on the browser/Windows engine; it is not a custom grammar or fantasy-name dictionary.

Incoming colour tiles are surfaces, not automatically interpreted physical height maps.

Open it again

Download the ZIP and choose Extract All. Open Jago-World.exe from the extracted folder. For offline browser use, open Jago-World.html. Workscape is a Windows companion. Keep native support folders with their Windows app.

Personal, professional and commercial use are welcome. The apps are open source and free forever. Check the rights of any fonts, images, scores or other assets you import.

Another direction to explore with Jago World.
